Quality Control Overview

QC Settings Used

Setting	Value
Minimum R ²	0.80
Minimum response proportion	0.10
Maximum response proportion	0.90
Maximum SJ sigma	500 ms
Maximum TOJ slope	500 ms
Anticipation threshold	100 ms
Minimum valid SRT trials	250
Maximum anticipations	5
Minimum mean RT	0.15 sec
Maximum mean RT	1.50 sec

What Are the QC Measures Asking?

QC Measure	What is it asking?
SJ Fit QC	Does the Gaussian adequately describe the observed SJ data? R ² must meet the minimum criterion, and sigma must be positive and below the maximum.
TOJ Fit QC	Does the logistic function adequately describe the observed TOJ data? R ² must meet the minimum criterion, and slope must be positive and below the maximum.
Response Range	Did the participant use both response options during the SJ or TOJ task?
Response Bias	Did the participant avoid extremely one-sided responding outside the allowed response proportions?
SRT Anticipation	Was a response so fast that it should be treated as anticipatory rather than a valid reaction?
Valid SRT Trials	Were enough trials with a recorded Adjusted_RT available to support the SRT summary?
Max. Anticipations	Did the participant stay within the maximum allowed number of anticipatory responses?
Mean SRT Range	Was the participant's mean adjusted reaction time within the specified acceptable range?
Overall QC	Did the participant pass all applicable QC checks? REVIEW means that at least one applicable criterion was not met and should be inspected.
